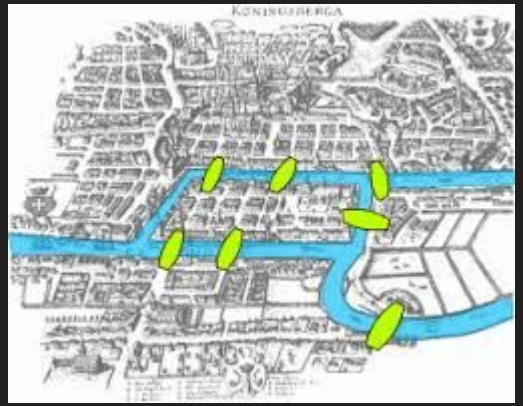
Content

1. Graph Theory Overview
2. Hierarchy and Implementation
3. Let’s Play!

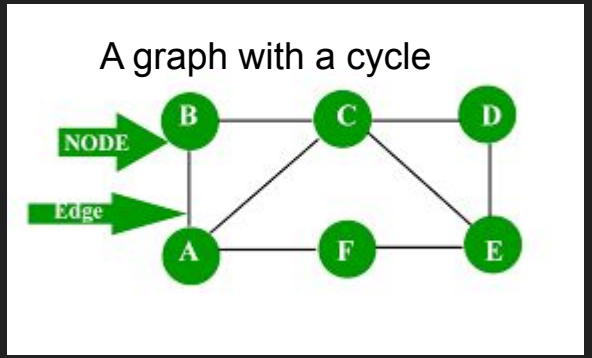
Project Overview

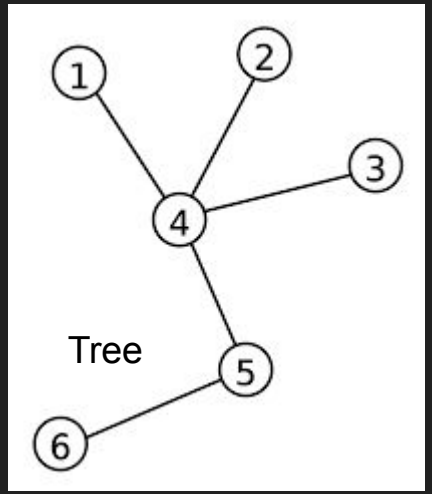
This project executes Depth First Search and Breadth First Search on a graph inputted by the user



Definitions

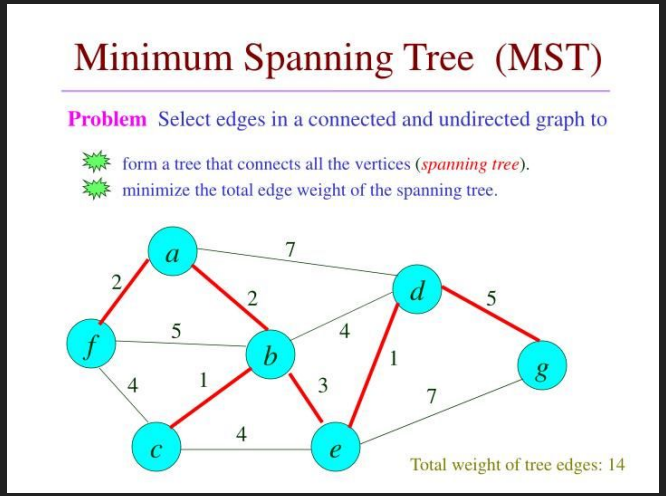
- A graph is a collection of nodes connected by edges
- A cycle is a set of vertices connected in a closed chain
- A tree is a connected graph with no cycles





Minimum Spanning Tree

- A minimum spanning tree is a subset of the edges of a graph which connects all the nodes together with no cycles
- MSTs are not always unique and different algorithms will yield different MSTs given the same inputs

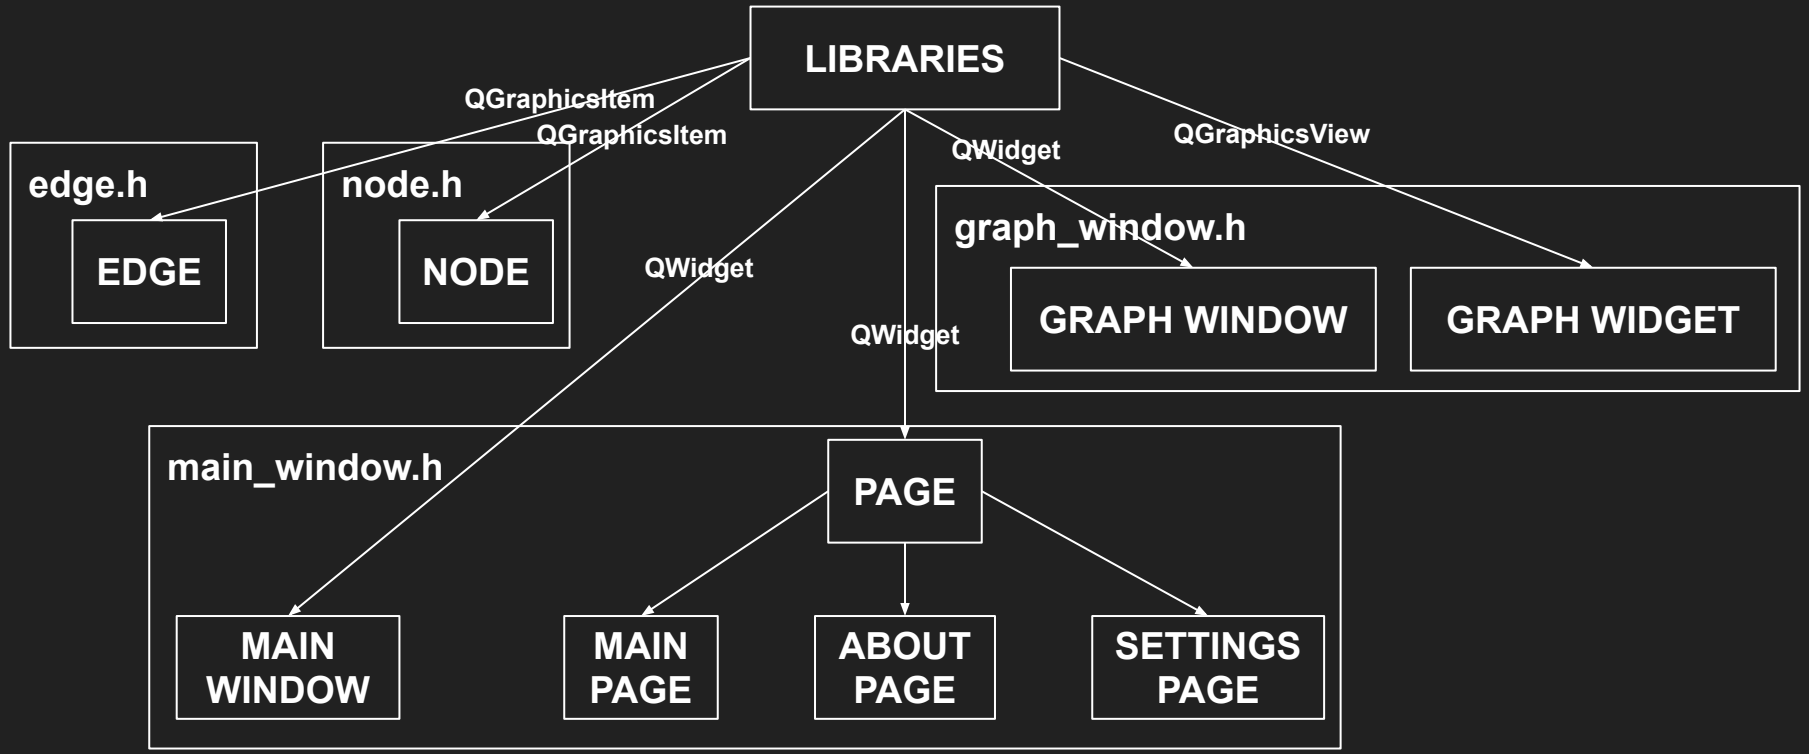


DFS vs BFS

- Depth First Search
- Finds MSTs by starting at root node, and exploring as far as possible before backtracking

- Breadth First Search
- Starts at root node, and explores all neighbors at current depth before moving onto nodes at the next depth

Class Hierarchies



Edge, Node, and Graph

- Edge
  - Stores pointers to graph, and two nodes
  - Mostly cosmetic - nodes do the heavy lifting
- Node
  - Stores a pointer to graph, a vector of neighbors, a bool indicating whether it has been explored, and an identification number
  - Use this to look at other nodes
  - Use this to add and delete edges
- Graph
  - Stores vector of nodes, and a vector of edges
  - Also knows which identification numbers are available
  - Use this to add and delete nodes

Main Window/Misc. Class Overview

- MainWindow: window that links the simulation, about and settings page
- Page: parent class of the pages; return the contents and buttons of the page
- Main Page: title page
- About Page: descriptions of the algorithm and what they do
- Settings Page: allows the music to be muted/unmuted
- StackedWidget

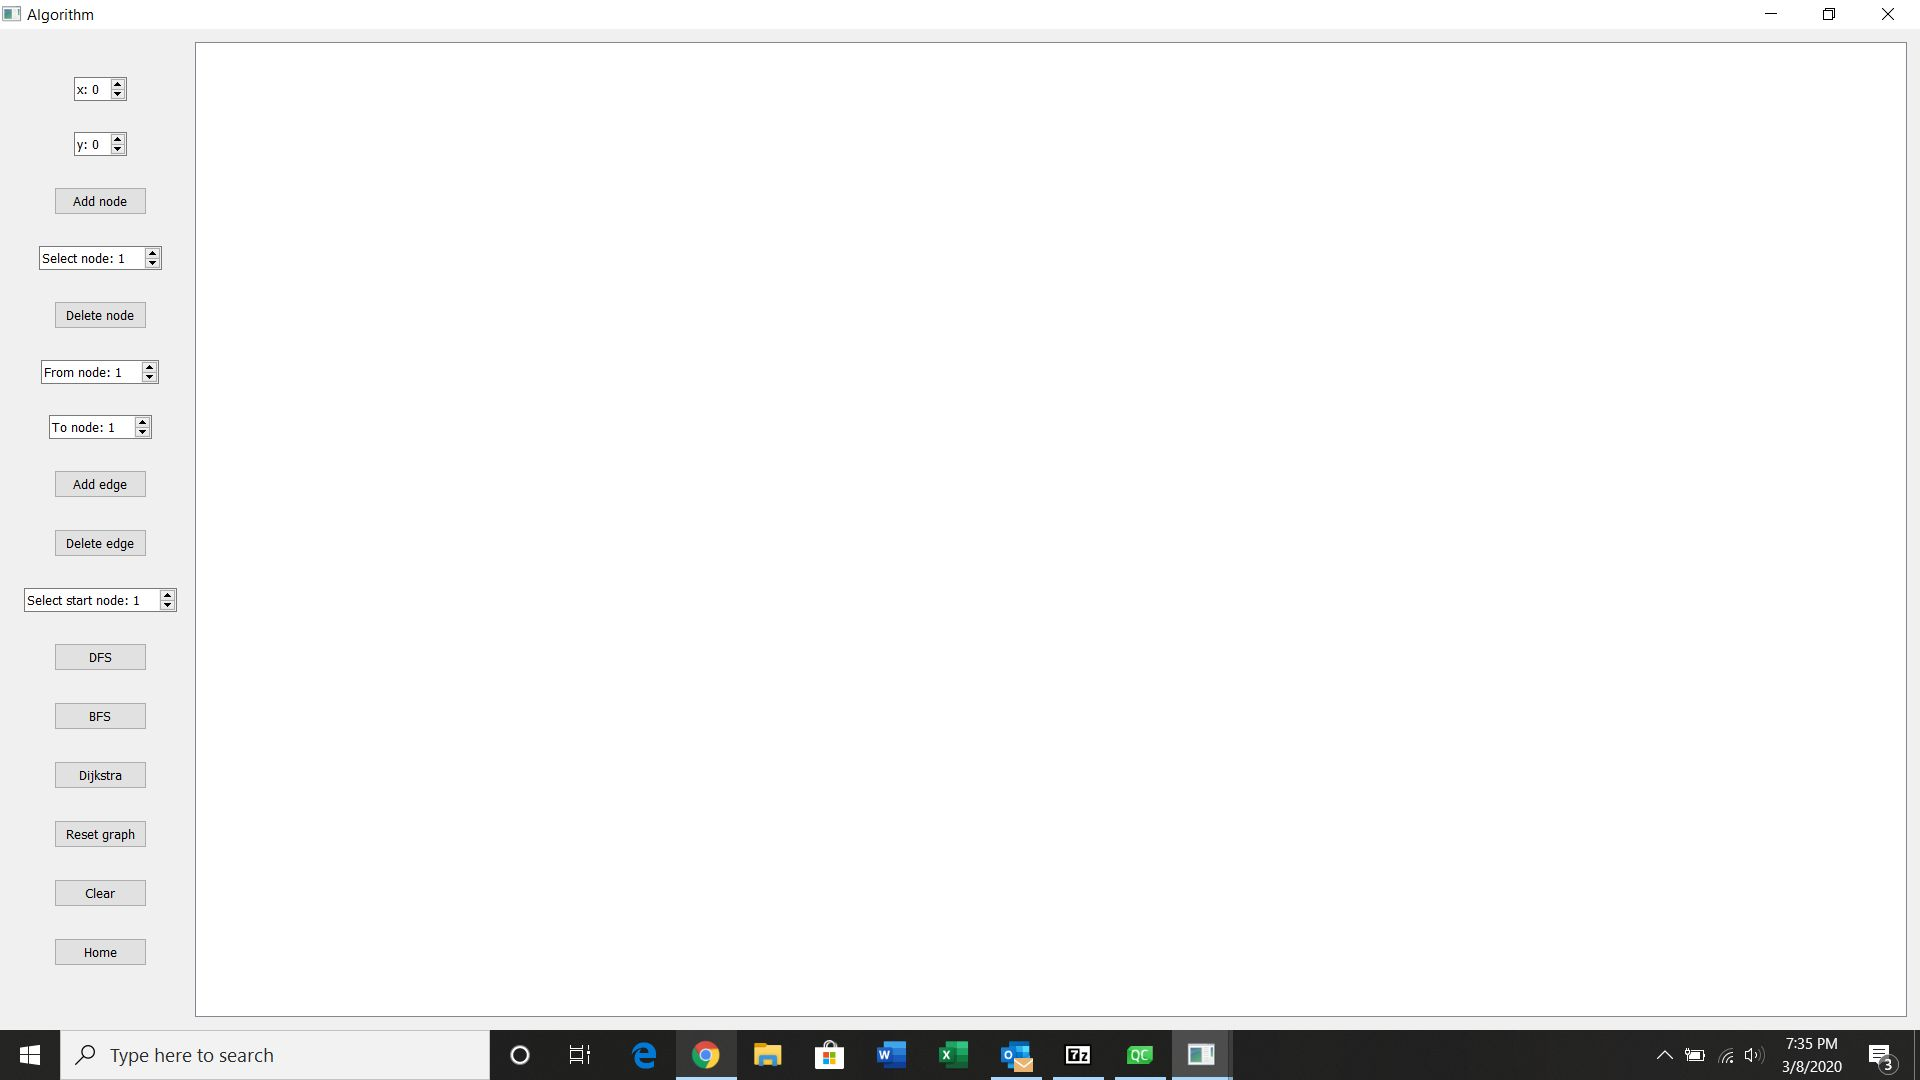
Graphs Class Overview

- Edge class: parameters of edge, e.g. source node & destination node.
- Node class: parameters of the node, e.g. neighbors, coordinate and node number

- GraphWindow class: contains all the buttons that allows addition/removal of nodes/edges, and signals algorithms when pressed.
- GraphWidget class: the graph that exists in GraphWindow; contains vectors of nodes and edges and paints them according to the user’s input



Algorithm
